More About Advanced Imaging Services at Scott Lake Veterinary Center

During a **CT Scan**, pets are placed under general anesthesia so we can obtain high-resolution images that allow us to identify a variety of medical issues such as masses, tumors, nasal polyps, shunts and more.

Fluoroscopy is a technique used to track fluid movement throughout the body (kind of like an x-ray movie) and can be useful in diagnosing things like megaesophagus, GERD or collapsing trachea.

If you're interested in learning more about our Advanced Imaging Services, visit scottlakevet.com or call us at (952) 447-4171.
